                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       This present sequence is that of a peptide antagonist of zonulin CC (2), one of 25 such peptides (see Y79105-29) of the invention, CC which bind to a zonula occludens toxin (20T) receptor. Yet do not CC (TJ). The peptide antagonists are based on a common motif of ZOT cC (TJ). The peptide antagonists are based on a common motif of ZOT preceptor in the prepared by chemical synthesis or by use of the combinant DNA techniques. The peptide antagonists are used as an CC antiinflammatory agents in the treatment of gastrointestinal confidence in the zor receptor in the intestinal confidence in the zor receptor in the intestinal confidence in the stinal permeability and the peptide is useful for CC intesting intestinal permeability and the peptide is useful for CC caused by infection, e.g. Clostridium difficile infection, antestinal overgrowth, whisple's disease, diseases with CC collagenous colitis, inflammatory bowel disease, diseases with CC correction of congenital heart disease with Fontan's operation, confiction tilestinal intestinal lymphamic and segmentaric confidence disease, disease, without ulceration, e.g. Menetrier's disease, cc. e.g. systemic lupus erythematosus or food allergies, primarily to cc. milk.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Query Match

CC (Ti). The pertide antagonists are based on a common motif of ZOT CC and human zonulins, which is believed to be critical for receptor CC recombinant DNA techniques. The peptide antagonists are lost of ZOT CC recombinant DNA techniques. The peptide antagonists are used as an CC inflammation, where they bind to the ZOT receptor in the intestinal CC and yet does not physiologically modulate the opening of Ty in the CC intestine. Gastrointestinal inflammation conditions give rise to CC treating intestinal permeability and the peptide is useful for CC caused by infection, e.g. Clostridium difficile infection, concerning the conditions that cause protein losing enteropathy CC enterocolitis, shigellosis, viral gastroenteritis, parasite mucosal erosion or ulcerations, e.g. gastritis, gastric cancer, lymphatic obstruction, e.g. congenital intestinal lymphangiectasia, correction of congenital heart disease, with Fontan's observation, collisis, inflammatory bowel disease, diseases marked by correction of congenital heart disease with Fontan's observation, collisis, inflammatory bowel disease, diseases with correction of congenital heart disease with Fontan's observation, collisis, shipplicy disease, diseases, diseases, diseases, with correction of congenital heart disease with Fontan's observation, collisis, and after surgical mucosal disease, without ulceration, e.g. Menetrier's disease, collisis, e.g. systemic lupus erythematosus or food allergies, primarily to milk.

The peptide antagonists are based on a common motif of ZOT CC and human zonulins, which is believed to be critical for receptor chinding. They can be prepared by chemical synthesis or by use of antiinflammatory agents in the treatment of gastrointestinal callinguation, where they bind to the ZOT receptor in the intestine candy et does not physiologically modulate the opening of TJ in the concerned intestinal permeability and the peptide is useful for treating intestinal permeability and the peptide is useful for treating intestinal conditions that cause protein losing enteropathy caused by infection, e.g. Clostridium difficile infection, enterocolitis, shigellosis, viral gastroenteritis, parasite infection, conlagenous colitis, inflammation, whipple's diseases with mucosal erosion or ulcerations, e.g. gastritis, gastric cancer, collagenous colitis, inflammatory bowel disease, diseases marked by imphatic obstruction, e.g. congenital intestinal lymphanglectasia, correction of congenital heart disease with Fontan's operation, correction of congenital heart disease with Fontan's operation, collagenous disease, eosinophilic gastroenteritis, and immune disease, collagense, eosinophilic gastroenteritis, and immune diseases, collagense, primarily to

Schinding. They can be proved to the combinant DNA techniques. The peptide antagonists are combinant DNA techniques. The peptide antagonists are combinant DNA techniques. The peptide antagonists are combinant DNA techniques. The peptide are gent in the intestinal inflammation, where they bind to the ZOT receptor in the intestine CC intestine. Gastrointestinal inflammation conditions give rise to increased intestinal permeability and the peptide is useful for CC treating intestinal conditions that cause protein losing enteropathy caused by infection, e.g. Clostridium difficile infection, enterocolitis, shigellosis, viral gastroenteritis, parasite infestation, bacterial overgrowth, whipple's disease, diseases with CC mucosal erosion or ulcerations, e.g. gastritis, gastric cancer, CC collagenous colitis, inflammatory bowel disease, diseases marked by Imphatic obstruction, e.g. congenital intestinal lymphangiectasia, correction of congenital heart disease with Fontan's operation, CC mucosal diseases without ulceration, e.g. Menetrier's disease, collac disease, eosinophilic gastroenteritis, and immune disease, e.g. ac. systemic lupus erythematosus or food allergies, primarily to
New peptide antagonist of zonulin useful as antiinflammatory agent treating cerebral ischemia, stroke, cerebral edema, gastritis, shigellosis, viral gastroenteritis, meningitis, encephalomyelitis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          WO200007609-A1.

                                                                                                                                                                                                   05-JUN-2000 (first entry)
                                                                                                                                                                                                                                                                                                                                                                                           Y36754-Y37949 are encoded by open reading frames (ORFs) of the genome of Chlamydia trachomatis (see Z01425). The polypeptides can be used as can also be used to control growth of the microorganism. Chlamydia trachomatis is responsible for a large number of diseases, e.g. eye paratrachoma, and inclusion conjunctivitis; genital diseases such as conventional trachoma, nonendemic trachoma, nongonococcal uretritis, epidymitis, cervicitis, salpingitis, and venereal lymphogranulomatosis. The polypeptides of the invention may be of use in treating these diseases.

CC (TJ). The peptide antagonists are based on a common motif of ZOT CC and human zonulins, which is believed to be critical for receptor CC binding. They can be prepared by chemical synthesis or by use of CC recombinant DNA techniques. The peptide antagonists are used as an ininflammatory agents in the treatment of gastrointestinal conditions where they bind to the ZOT receptor in the intestine CC inflammation, where they bind to the ZOT receptor in the intestine CC increased intestinal permeability and the peptide is useful for CC caused by infection, e.g. Clostridium difficile infection, conditions that cause protein losing enteropathy CC enteroclitis, shighlosis, viral gastroenterits, parasite CC infestation, bacterial overgrowth, whipple's disease, diseases with CC cultagenous colitis, inflammatory bowel disease, diseases marked by arcoidosis lymphoma, mesenteric tuberculosis, and after surgical CC correction of congenital heart disease with Fontan's operation, CC sarcoidosis lymphoma, mesenteric tuberculosis, and after surgical CC coeliac disease, eosinophilic gastroenteritis, and immune disease, CC efficiency systemic lupus erythematosus or food allergies, primarily to conlike.

                                                                                                                                                                                                                                                                                                                                                                       c recombinant DNA techniques. The peptide antagonists are used as an inflammation, where they bind to the 207 receptor in the intestinal inflammation, where they bind to the 207 receptor in the intestine and yet does not physiologically modulate the opening of TJ in the intestine. Gastrointestinal inflammation conditions give rise to increased intestinal permeability and the peptide is useful for treating intestinal conditions that cause protein losing enteropathy caused by infection, e.g. Clostridium difficile infection, enterocolitis, shigellosis, viral gastroenteritis, parasite infestation, bacterial overgrowth, whipple's disease, diseases with mucosal erosion or ulcerations, e.g. gastritis, gastric cancer, collagenous colitis, inflammatory bowel disease, diseases marked by lymphatic obstruction, e.g. congenital intestinal lymphanglectasia, sarcoidosis lymphoma, mesenteric tuberculosis, and after surgical correction of congenital heart disease with Fontan's operation, coeliac disease, eosinophilic gastroenteritis, and immune disease, coeliac disease, eosinophilic gastroenteritis, and immune disease,

```
MAP is the french acronym for piglet fatal wasting disease. The polypeptides can be used to detect anti-MAP antibodies. The antibodies can be used to detect map antipens. The nucleotide sequences can be used as probes or primers for detecting MAP nucleit acids. The nucleotide sequences, polypeptides, vectors, (pseudo)viral particles, transformed cells and compounds selected by the screening assay can be used in pharmaceutical compositions. The polypeptides, nucleotide sequences, vectors and transformed cells can be used in vaccines against MAP corrections. The vectors, (pseudo)viral particles and

                                                                                                                                                       Purified carbamate hydrolase can be used to isolate/identify A.oxidans carbamate hydrolase gene system. This system makes plants resistant to the herbicide phenmedipham. Carbamate hydrolase has pH optimum 6.8, mol. wt. 50-60kp, isoelectric point 6.2, and can cleave phenmedipham to methyl 3-hydroxyphenylcarbamate, m-toluidine and CO2, so inactivating it. It is produced by A.oxidans DSM 4044 which contains the 41 kb plasmid
                                                                                                                                                                                                                                                                                                       destroy herbicide phenmedipham, and DNA encoding it, for imparting resistance to plants.
                                                                                                                                                                                                                                                                       Disclosure; Fig 7; 17pp;

This sequence represents the human type II collagen alpha-chain which CC is used in a method to produce an immunoassay kit comprising of two CC antibodies (Ab1 and Ab2), mono- or poly-clonal, or their fragments, CC II collagen fragment that is released from degraded cartilage). The kits immunoassays, specifically enzyme-linked CC are designed for sandwich immunoassays, specifically enzyme-linked CC serum or synovial fluid). The kits are used for therapy, diagnosis (e.g. coutine screening for arthritis and other cartilage diseases, also to CC remunatorial arthritis and osteoarthritis, or monitoring progression of CC growth hormone) and for drug screening (to identify, and assess efficacy CC of, anti-arthritic agents and matrix metalloprotease inhibitors). CC cliffee, derived from the N-terminus of the alpha I chain, have CC concentration that allows accurate measurement by immunoassay.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Immunoassay kit containing two antibodies recognising coupled epitope(s) on collagen fragments - and new antibodies, for diagnosing arthritis etc., also prognosis and screening for anti-arthritic agents or inhibitors of matrix metallo-protease
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Type II collagen alpha-chain; human; immunoassay; antibody; C-IIfree; epitope; cartilage; enzyme-linked immunosorbent assay; ELISA; therapy; diagnosis; arthritis; growth disorder; prognosis; drug screening; anti-arthritic agent; matrix metalloprotease inhibitor.

                                                                                                                                                                                                                                                           This peptide comprises the first epidermal growth factor-like domain (EGF-1), i.e. amino acid residues 105-135, of human Zneul (see w88381), a new neuro-growth factor-like protein. Zneul can be used as a growth, maintenance, or differentiation factor in the spinal cord, heart, spleen, testis, thyroid and lymph nodes. It may also play a role in breast cancer, glioblastomas, and pituitary adenomas. Zneul may also be used cancer, to repopulate blood cells after chemotherapy, to stimulate myofibroblast proliferation, stimulate or inhibit growth factors made in the placenta, in fertility and contraception, or to use also cancer.

The including specific domains (see also W88384-85) of Zneul. Zneul is a new neuro-growth factor-like protein that can be used as a growth, maintenance, or differentiation factor in the spinal cord, heart, spleen, testis, thyroid and lymph nodes. Zneul may also play a role in breast cancer, glioblastomas, and pituitary adenomas. Zneul can be used to treat Alzheimer's disease, cancer, to repopulate blood cells after chemotherapy to stimulate myofibroblast proliferation, stimulate or inhibit growth factors made in the placenta, in fertility and contraception, or to regenerate nerves. Claimed Zneul polypeptides (see also W88382-97), including specific domains of Zneul and epitope-bearing portions of Zneul, can be used to raise specific antibodies for use e.g. in

                                                                                        the G surface protein of Paramecum primaurelia.";

J. Mol. Biol. 211:521-535(1990).

-I- FUNCTION: THIS PROTEIN IS THE SURFACE ANTIGEN OR IMMOBILIZATION ANTIGEN OF PARAMECIUM PRIMAURELIA.

-I- SUBCELLULAR LOCATION: ATTACHED TO THE MEMBRANE BY A GPI-ANCHOR.

-I- MISCELLANEOUS: IT HAS INTERNAL HONOLOGIES AND A HIGHLY PERIODIC CONTAINING B CYSTEINES, EXCEPT FOR FOUR HALF PERIODS. A VARIABLE PART OF 475 RESIDUES COMPRISES 4 ALMOST IDENTICAL PERIODS IN THE
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 G168_PARPR

FUNCTION: THIS PROTEIN IS THE SURFACE ANTIGEN OR IMMOBILIZATION ANTIGEN OF PARAMECIUM PRIMAURRLIA.

SUBCELLULAR LOCATION: ATTACHED TO THE MEMBRANE BY A GPI-ANCHOR.

MISCELLANEOUS: IT HAS INVERNAL HOMOLOGIES AND A HIGHLY PERIODIC STRUCTURE WITH 37 PERIODS OF ABOUT 75 RESIDUES, EACH PERIOD CONTAINING 8 CYSTEINES, EXCEPT FOR FOUR HALF PERIODS. A VARIABLY PART OF 475 RESIDUES COMPRISES 4 ALMOST IDENTICAL PERIODS IN THE PART OF 475 RESIDUES COMPRISES 4 ALMOST IDENTICAL PERIODS IN THE PART OF 475 RESIDUES COMPRISES 4 ALMOST IDENTICAL PERIODS IN THE PART OF 475 RESIDUES COMPRISES 4 ALMOST IDENTICAL PERIODS IN THE PART OF 475 RESIDUES COMPRISES 4 ALMOST IDENTICAL PERIODS IN THE PART OF 475 RESIDUES COMPRISES 4 ALMOST IDENTICAL PERIODS IN THE PART OF 475 RESIDUES COMPRISES 4 ALMOST IDENTICAL PERIODS IN THE PART OF 475 RESIDUES COMPRISES 4 ALMOST IDENTICAL PERIODS IN THE PART OF 475 RESIDUES COMPRISES 4 ALMOST IDENTICAL PERIODS IN THE PART OF 475 RESIDUES COMPRISES 4 ALMOST IDENTICAL PERIODS IN THE PART OF 475 RESIDUES COMPRISES A PART OF 475 RESIDUES COM

"Murine subtilistin-like proteinase SPC6 is expressed during embryonic implantation, somitogenesis, and skeletal formation.";

Dev. Genet. 21:75-81(1997).

10-ev. Genet. 21:75-81(1997).

11-FUNCTION: LIKELY TO REBPRESENT A WIDESPREAD ENDOPROTEASE ACTIVITY WITHIN THE CONSTITUTIVE AND REGULATED SECRETORY PATHWAY. CAPABLE OF CLEAVAGE AT THE RX(K/R)R CONSENSUS MOTIE. MAY BE RESPONSIBLE FOR THE MATURATION OF GASTROINTESTINAL PEPTIDES. MAY BE INVOLVED IN THE CELULLAR PROLIFERATION OF ADRENAL CORTEX VIA THE ACTIVATION OF GROWTH FACTORS.

1-CATALTYTIC ACTIVITY: RELEASE OF MATURE PROTEINS FROM THEIR CONTENT OF THE RESPONSIBLE FOR THE MATURE PROTEINS FROM THEIR CATALTYTIC ACTIVITY: RELEASE OF MATURE PROTEINS FROM THEIR CONTENT OF THE MATURE PROTEINS FROM THEIR CATALTYTIC ACTIVITY: RELEASE OF MATURE PROTEINS FROM THEIR CATALTYTIC ACTIVITY: RELEASE OF MATURE PROTEINS FROM THEIR CATALTYTIC MATURE PROTEINS FROM THE CATALTYTIC MATURE PROTEINS FROM THE PROTE

```

```
E6.5, PROMINENT EXPRESSION OBSERVED IN DIFFERENCIATED DECIDUA. AT E7.5, INTENSE EXPRESSION IN EXTRABBRYONIC ENDODERM, AMNOIN AND NASCENT MESODERM. AT 8.5, ABUNDANT EXPRESSION IN SOMITES AND YOLK SAC FOLLOWED BY A CONFINATION TO DERMAMYOTOME COMPARTMENT. BETWEEN E9.5 AND E11.5, ABUNDANT EXPRESSION IN HER LIMES IS CONFINED TO THE CONDENSING MESENCHYM SURROUNDING THE CARTILAGE. AT THIS STAGE, STRONG EXPRESSION ALSO DETECTED IN VERTEBRAL AND FACIAL CARTILAGE PRIMORDIA AND IN THE MUSCLE OF THE TONGUE. AT E16.5, ABUNDANT EXPRESSION IN EPITHELIAL CELLS OF THE INTESTINAL VILLI. ISOFORM B OCCUR AT E12.5.
